

WebPascal script model tutorial - Same name function

2017-01-04 11:18:48 99⁺

The script model provides some basic functions, and some functions in Delphi have the same name, the usage is the same, such as copy, trim, etc., some are as follows, please refer to the basic grammar article and part of the documentation readme.txt

```
1  formatdatetime('yyyy-MM-DD hh:mm:ss.zzz',now);
2  |<?formatdatetime('yyyy-MM-DD hh:mm:ss.zzz',now);?>
3  formatfloat('#,##0.#0',555.55);
4  |<?formatfloat('#,##0.#0',555.55);?>
5  copy('abcdefg',pos('e','abcdefg'),2);
6  |<?copy('abcdefg',pos('e','abcdefg'),2);?>
7  length('12345');
8  |<?length('12345');?>
9  trim(' abc ');
10 |<?trim(' abc ');?>
11 md5('123456');
12 |<?md5('123456');?>
13 base64('123456',true/false);
14 |<?base64('123456',true);'|base64('MTIzNDU2',false);?>
15 StrToFloat('55.55');
16 |<?StrToFloat('55.55');?>
17 Trunc(55.55);
18 |<?Trunc(55.55);?>
```

Base64 has a special introduction in the previous article, base64+md5+copy function, can be used to generate some encrypted content, such as the password of the user login in the background of the website, so it will be safer, thus avoiding the password to save the code and leaking the loss. Hey.
