

WebPascal script model tutorial - Write script internal functions

2018-06-09 00:04:00

1

Inside the script, you can actually write scripts. For example, if a small function is used repeatedly, it can be written as a small function, but it should be noted that this small function is only valid in the current script.

```
1  <?
2  // Defining function
3  function $wlog
4  begin
5      Log($Params.0+' Total '+$params.count+' parameters.', $Params.1);
6  end;
7  function $wlog2
8  begin
9      log($msg,$fname);
10 end;
11 //call function
12 $wlog('log1','log');
13 // Note that because the variable name is given, the order does not matter. Do not bring $ when filling
14 in the parameters.
15 $wlog2(fname:'log',msg:'log2');
16 ?>
```

result :

```
1  2018-06-09 00:02:21.285; log1 Total 2 parameters.
2  2018-06-09 00:02:21.287; log2
```

Is it very simple? Have you learned it?
